

Matched-control sensitivity analysis of computational perturbation responses

Ten candidates, 200 disjoint noncandidate controls, and four outcome-independent matching variables

A

Candidate positions within assigned control groups

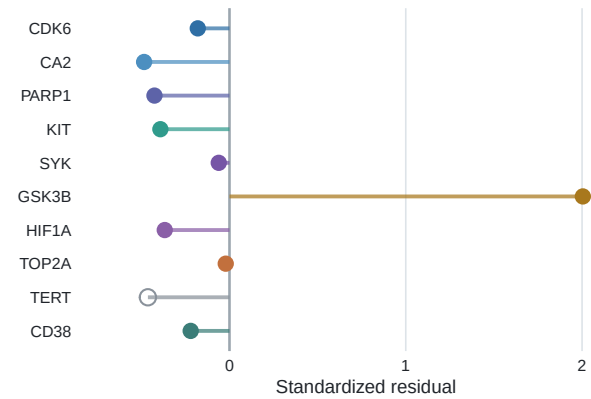

Diamonds: candidates; boxes and points: 20 controls per candidate

B

Standardized response residuals

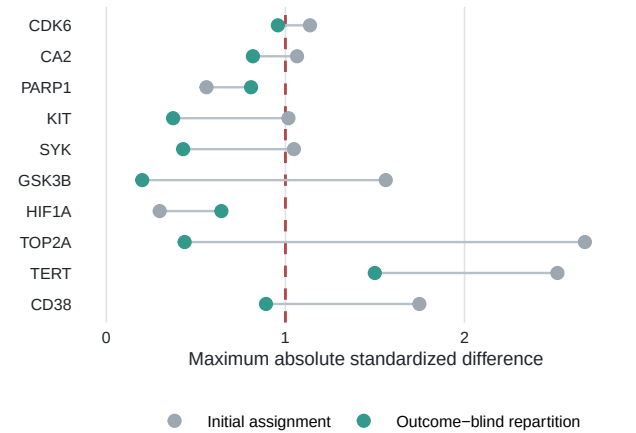

TERT excluded from calibrated comparison

C

Maximum baseline-covariate imbalance

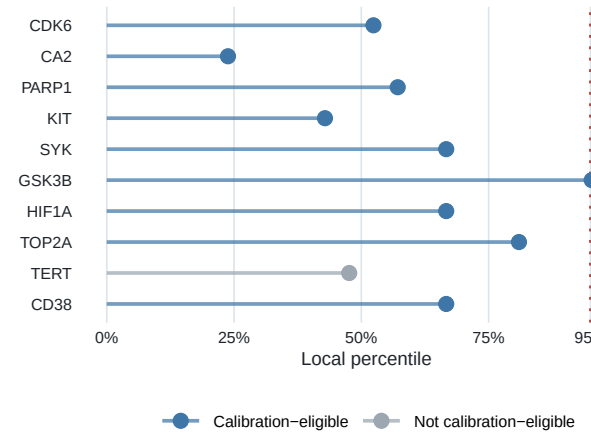

Dashed line: absolute standardized difference of 1

D

Local matched-control percentile

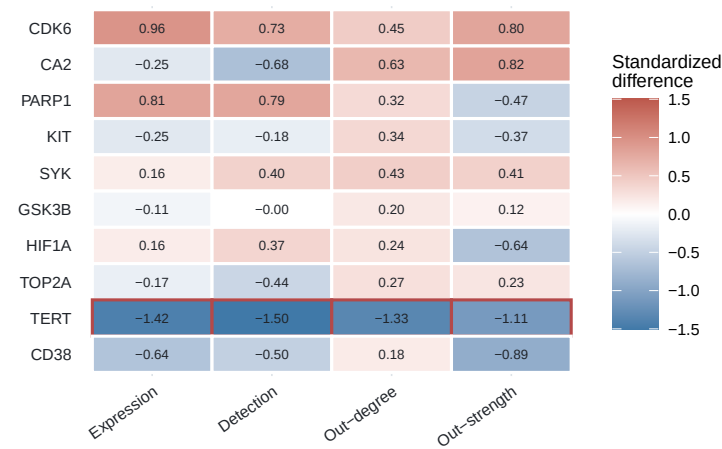

Dotted line marks the 95th percentile

E

Candidate-control balance for four matching variables

Red borders mark absolute standardized differences > 1

F

Pooled leave-one-out null distribution

Colored rug marks: nine calibrated candidate residuals
